The Problem: A Big Gap in Understanding Health

- Lab reports are written for doctors, not patients.
- About 24.5% of adults in the Netherlands find health information hard to understand.
- About 21-28% of Dutch adults skip a specialist visit because it costs a lot of money.
- In the US, about 88% of adults have trouble with health information - this costs \$238 billion every year.
- LabBridge wants to close this gap, so everyone can understand their own health, no matter their education, income, or language.

Who We're Building For

Target Users and Our Solution

Target Users

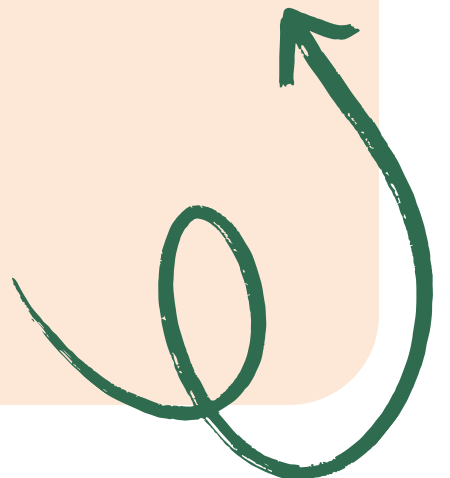

We built this for patients who get a lab report but can't easily understand it - or can't afford or reach a doctor to explain it.

The Process

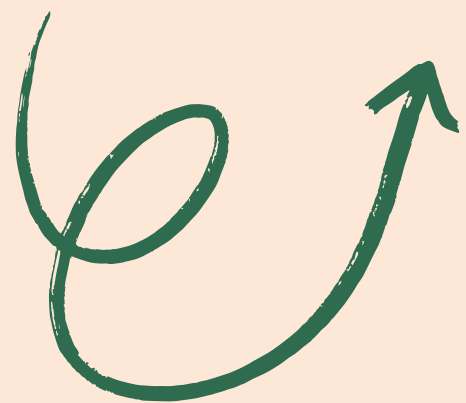

The patient enters their lab report. An AI model reads it and writes an easy-to-understand explanation.

Patient Guide

The result is a simple guide: a short summary, an explanation of each result, and clear next steps to take.

Ethical Reflection: Risks and Mitigations

01

Misinterpretation

If the AI sounds very sure of itself, people might think its explanation is a real diagnosis. This is most dangerous for people who can't easily check if the AI got it wrong.

02

Quality Disparities

The AI may give better explanations in some languages or formats than others. We need to design it carefully so everyone gets an explanation they can understand.
